# OUTLINE

1. Introduction
2. Exergy-based Life Cycle Assessment (E-LCA)
3. E-LCA of Advanced Metering Infrastructure (AMI)
4. E-LCA of ICT for Smart Grids
5. Conclusions

# OUTLINE

## 1. Introduction

- 2. Exergy-based Life Cycle Assessment (E-LCA)
- 3. E-LCA of Advanced Metering Infrastructure (AMI)
- 4. E-LCA of ICT for Smart Grids
- 5. Conclusions

# THE PROMISE OF THE SMART GRID

## Goals

- Improvement of energy efficiency
- Integration of renewable energy sources
- Reduce peak demand

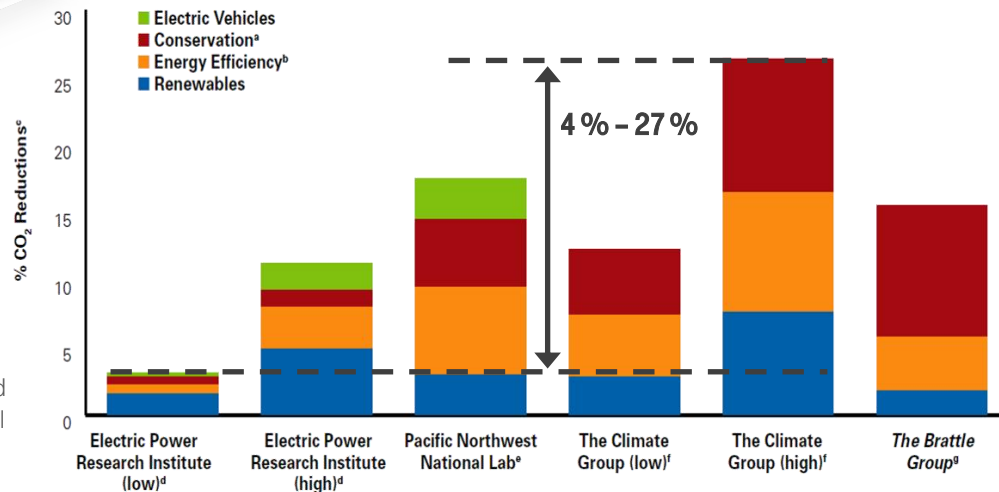

Source: "The Promise of the Smart Grid: Goals, Policies, and Measurement Must Support Sustainability Benefits", Natural Resources Defense Council, 2012

## The Smart Grid concept is mainly driven by

- Distributed generation
- Energy storage systems
- Demand side management

## Potential CO<sub>2</sub> Reductions (Results from 4 Studies)

# ICT FOR SMART GRIDS

- Deployment of additional ICT equipment in various smart grid domains (e.g., customer, distribution, operations) will lead to a further increase in electricity consumption and additional e-waste

# ADDITIONAL ICT EQUIPMENT

## Smart Meters

- Hundred Millions in Europe
- Power Consumption  $\approx 1\text{ W} - 5\text{ W}$

## Data Concentrators

- Hundreds of Thousands in Europe
- Power Consumption  $\approx 10\text{ W}$

## Home Energy Management System (HEMS)

## Communication Network Infrastructure

## Data Centers

- Hundreds of Millions in Europe
- Power Consumption  $\approx 10\text{ W} - 100\text{ W}$

- Several small/medium size DCs
- Power Consumption  $\approx \text{kW} - \text{MW}$

# OUTLINE

1. Introduction

## **2. Exergy-based Life Cycle Assessment (E-LCA)**

3. E-LCA of Advanced Metering Infrastructure (AMI)

4. E-LCA of ICT for Smart Grids

5. Conclusions

# COMPARISON BETWEEN THERMODYNAMIC INDICATORS

Indicator Type	Advantage	Disadvantage
Energy analysis	<ul style="list-style-type: none"> <li>Enables energy assessment and evaluation by the use of <u>the first law of thermodynamics</u></li> </ul>	<ul style="list-style-type: none"> <li><u>Different forms of energy cannot be directly compared</u></li> <li><u>Environmental effects cannot be directly assessed</u></li> </ul>
Life cycle assessment (LCA)	<ul style="list-style-type: none"> <li>Allows a <u>very detailed and thorough assessment</u> of environmental effects</li> </ul>	<ul style="list-style-type: none"> <li><u>Difficult</u> to derive</li> <li><u>Lack of a simple and unambiguous outcome</u> for easy comparison purposes</li> </ul>
Exergy-based life cycle assessment (E-LCA)	<ul style="list-style-type: none"> <li><u>Different forms of energy</u> can be directly compared</li> <li><u>Simpler</u> to obtain than a LCA</li> <li>Leads to a <u>single value for easy comparison</u> purposes</li> </ul>	<ul style="list-style-type: none"> <li>Does <u>not</u> allow a <u>thorough assessment</u> of environmental effects</li> </ul>

# CRADLE-TO-GRAVE APPROACH

Most studies concentrate on the operation or use phase of ICT equipment only

Drawback: Other life cycle stages of ICT equipment not considered, such as:

Raw material extraction and  
processing

Manufacturing and assembly

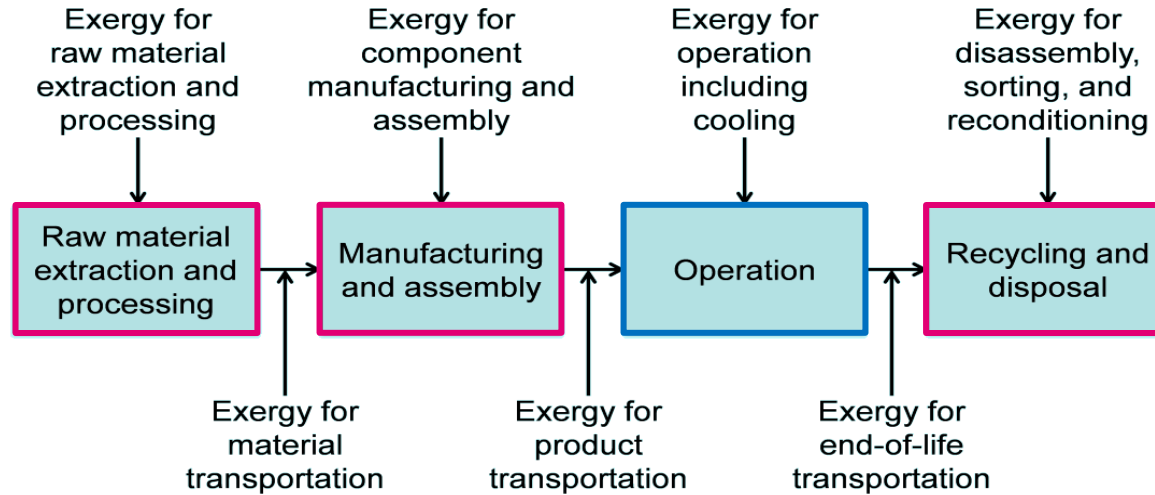

Disposal and recycling

Transportation

# EXERGY CONSUMPTION IN DIFFERENT LIFE CYCLE STAGES

- Embodied exergy consumption (EEC): exergy consumed during *raw material extraction and processing, manufacturing and assembly, recycling and disposal, as well as transportation* of materials and products
- Operational exergy consumption (OEC): exergy consumed during the *operational or use phase* of the equipment

# OUTLINE

1. Introduction

2. Exergy-based Life Cycle Assessment (E-LCA)

**3. E-LCA of Advanced Metering Infrastructure**

4. E-LCA of ICT for Smart Grids

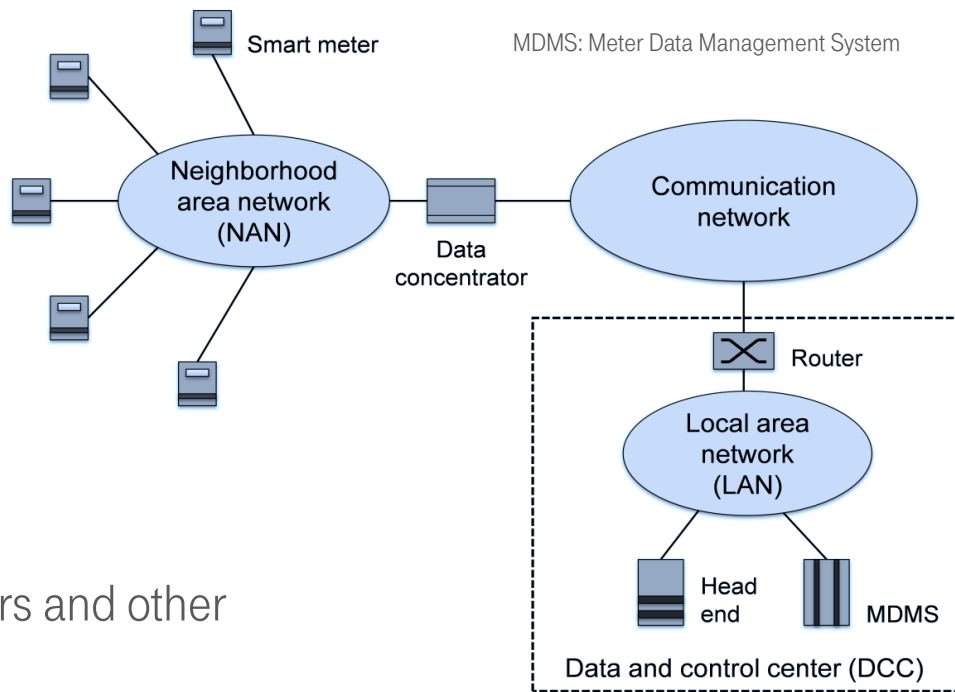

5. Conclusions

# ADVANCED METERING INFRASTRUCTURE (AMI)

- Key enabling technology for Smart Grids
- Crucial component is the Smart Meter

- AMI enables:

- two-way communication between the meter and the central system
  - better management of energy networks and more efficient consumption
- However, a large number of smart meters and other components have to be installed

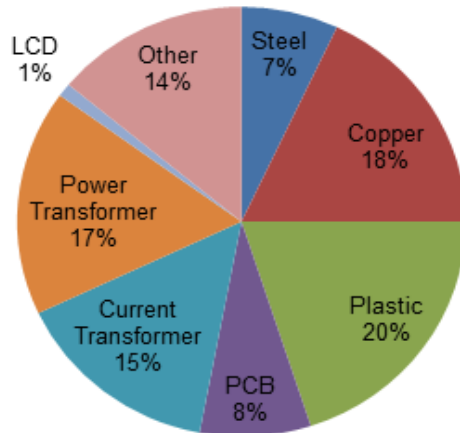

# SMART METERS

## ROW MATERIAL EXTRACTION AND PROCESSING PHASES

- First, we defined the typical material/component composition of smart meter
- Then, we applied a combined analytical and experimental analysis and used data from various sources with the aim to increase the data accuracy

Typical material/component composition

CoBCom 2020

Relative contributions to weight and exergy consumption

Prof. Dr. Slavisa Aleksic

# SMART METERS

## MANUFACTURING AND ASSEMBLY PHASES

Relative contribution of some select manufacturing processes to the total exergy consumption of the manufacturing and assembly phase

- The manufacturing of the processor accounts for more than 90% of the total exergy consumption in this life cycle stage

# SMART METERS

## OPERATION AND TRANSPORTATION PHASES

- Operation

Main assumptions for the operation phase

Operational parameter [unit]	Value
Peak power consumption [W]	3
Average load [%]	50
Daily uptime [%]	100
Operational duration [years]	15

The total exergy consumption: 709.56 MJ

- Transportation

Main assumptions for transportation

Mode of transportation	Specific exergy [kJ/kg-km]
Air	22.41
Truck	2.096
Rail	0.253
Ship	0.296

The total exergy consumption: 351.7 MJ

# SMART METERS

## RECYCLING PHASE AND TOTAL EXERGY CONSUMPTION

- **Recycling and Disposal**

- An order of magnitude estimate approach was assumed
- Exergy consumed: 520 kilo Joules per kilogram (kJ/kg)
- The total exergy consumption approx. **1.2 MJ**

- **Overall Lifetime Exergy Consumption**

Life cycle stage	Exergy consumption [MJ]	Exergy consumption [%]
Raw material extraction and processing	<b>3rd</b> 135	6.08
Material transportation	7.15	0.32
Manufacturing and assembly	<b>1st</b> 1,345.16	60.57
Product transportation	19.55	0.88
Operation	<b>2nd</b> 709.56	31.95
End-of-life transportation	3.25	0.15
Recycling and disposal	1.2	0.05
Total	2,220.87	100

# SMART METERS

## EMBODIED AND OPERATIONAL EXERGY

Lifetime embodied exergy consumption (EEC) and operational exergy consumption (OEC) distribution of the smart meter

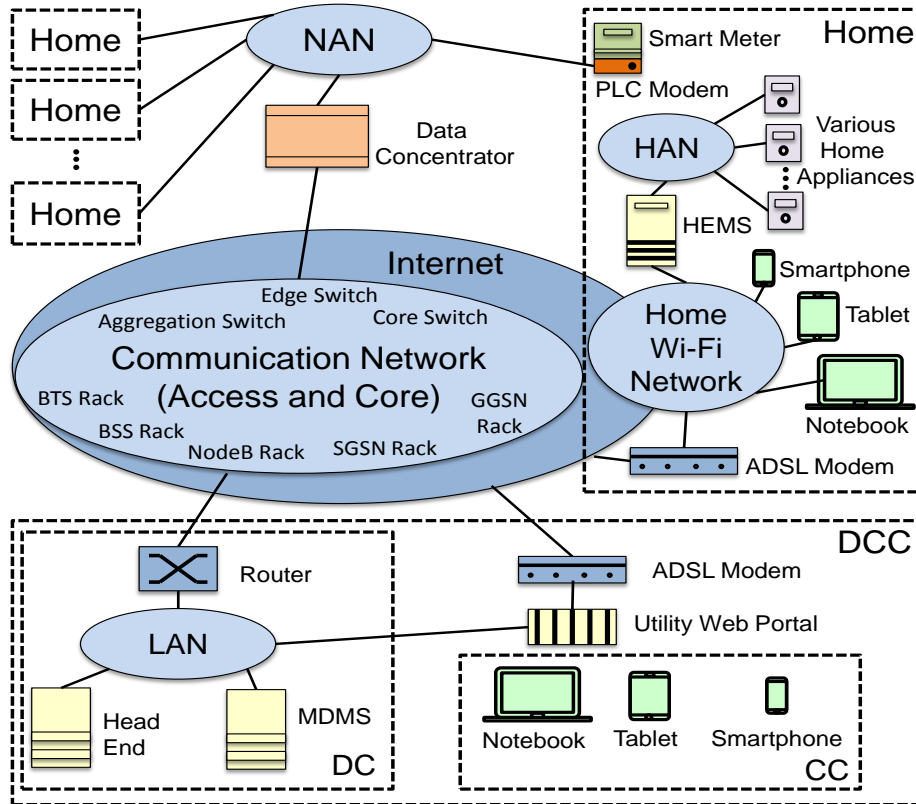

- The embodied exergy consumption (EEC) is responsible for more than 68% of the total exergy consumption

# OUTLINE

1. Introduction
2. Exergy-based Life Cycle Assessment (E-LCA)
3. E-LCA of Advanced Metering Infrastructure (AMI)
- 4. E-LCA of ICT for Smart Grids**
5. Conclusions

# ICT FOR SMART GRIDS

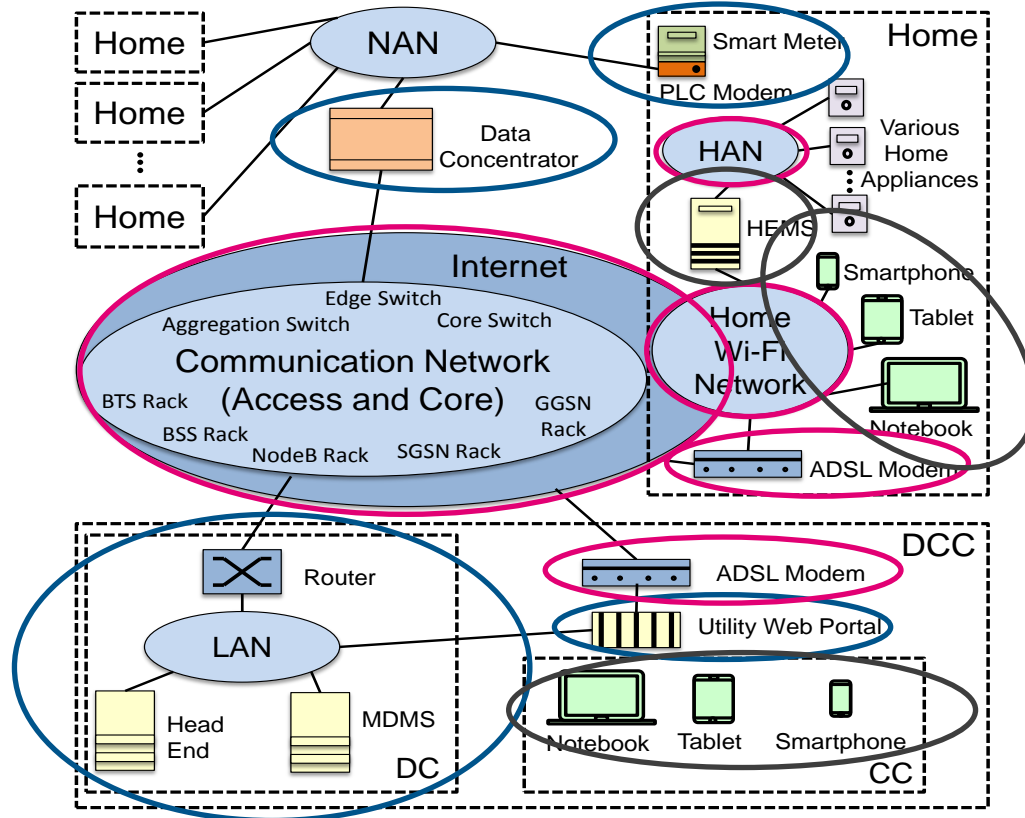

## OVERALL MODEL

PLC:	power line communication
HAN:	home area network
LAN:	local area network
WLAN:	wireless local area network
DSL:	digital subscriber line
HEMS:	home energy management system
NAN:	neighborhood area network
RAN:	radio access network
CN:	core network
MDMS:	meter data management system
UEMS:	utility energy management system
DC:	data center
CC:	control center
DCC:	data and control center

# ICT FOR SMART GRIDS

## OVERALL MODEL

- Utility Equipment (UE):
  - smart meters
  - PLC modems
  - data concentrators
- Data and Control Center (DCC)
- Network Equipment:
  - BTS
  - BSC
  - Node B
  - RNC
  - Switches
  - Routers
  - Cables
- User Devices (UDs):
  - Smartphones
  - Tablets
  - Notebooks
  - HEMSs

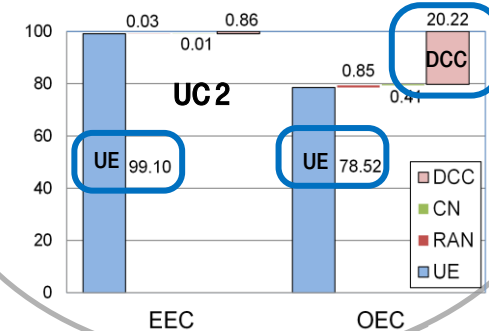

# SUSTAINABILITY OF ADVANCED METERING INFRASTRUCTURE (1)

## Influence of the equipment lifetime

Use Case (UC)	UE lifetime [years]		
	Smart meter	PLC modem	Data concentrator
UC 1: short lifetime	5	5	3
UC 2: medium lifetime	15	10	7
UC 3: long lifetime	20	15	10

Relative Contributions after 20 Years of Operation

Results of the Model  
for the City of Vienna

EEC: Embodied Exergy Consumption  
OEC: Operational Exergy Consumption

# SUSTAINABILITY OF AMI/HAN

## Influence of the equipment lifetime

Use Case (UC)	UDs lifetime [years]					UE lifetime [years]	
	Smartphone	Tablet	Notebook	HEMS	DSL modem	Smart meter	PLC modem
UC 1: short lifetime	1	1	2	2	3	5	5
UC 2: medium lifetime	2	2	3	4	5	15	10
UC 3: long lifetime	4	4	6	6	10	20	15

Relative Contributions after 20 Years of Operation

## Results of the Model for the City of Vienna

HAM: Home Area Network  
 HEMS: Home Energy Management System  
 EEC: Embodied Exergy Consumption  
 OEC: Operational Exergy Consumption

# OUTLINE

1. Introduction
2. Exergy-based Life Cycle Assessment (E-LCA)
3. E-LCA of Advanced Metering Infrastructure (AMI)
4. E-LCA of ICT for Smart Grids

## **5. Conclusions**

# CONCLUSIONS (1)

- Smart Grids have the potential to improve the global energy efficiency
- The realization of the smart grid will only be possible by a pervasive deployment and use of information and communication technologies (ICT)
- However, additional ICT equipment will unavoidably lead to a higher energy consumption and an impact on the environment
- Embodied exergy consumption (EEC) is dominating
  - Almost 2 times higher than the operational exergy consumption (OEC)
  - Indicates the importance of considering the entire lifecycle

# CONCLUSIONS (2)

- The most environmentally impacting lifecycle stage is the manufacturing and assembly phase
  - It accounts for 60% of the total exergy consumption
  - The manufacturing of the processor counts for more than 90% of the total exergy consumption in this life cycle stage
- The contribution of transportation is less than 2% of the total
- Increase of the equipment's lifetime can lead to a reduction of the cumulative embodied exergy consumption (EEC) by about 62%

## Recommendations:

- Increase equipment's lifetime
- Improve efficiency of manufacturing and assembly processes
- Increase energy efficiency of servers and data centers

# Thank you for your attention
